

Amropali Mango Fruit Disease Report

Prepared for: Dr. Arpon
Date: August 14, 2026 12:28 PM

Prediction: Anthracnose (94.14% confidence)

Classification Scores

#	Class	Conf. %
1	Anthracnose	94.14
2	Sooty Mould	2.01
3	Scab	1.10
4	Stem End Rot	0.87
5	Bacterial Canker	0.78
6	Powdery Mildew	0.65
7	Healthy	0.45

Disease Details: Anthracnose

Scientific name: *Colletotrichum gloeosporioides*

A major fungal disease affecting mango leaves, flowers, and fruits. It causes significant post-harvest losses and can devastate entire crops if not managed promptly.

Symptoms

- Dark brown to black irregular spots on leaves
- Water-soaked lesions that enlarge rapidly
- Premature leaf drop and defoliation
- Blossom blight and twig dieback
- Fruit rot that remains latent until ripening

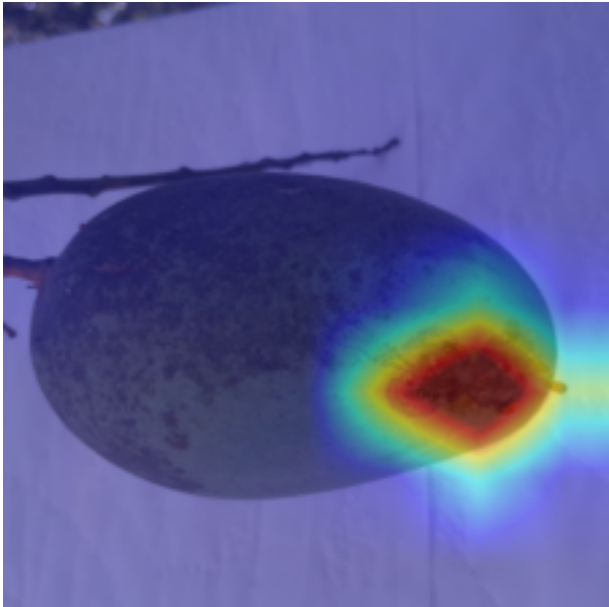

Recommended Treatment

- + Apply copper-based fungicides (Bordeaux mixture)
- + Use systemic fungicides like Carbendazim or Mancozeb
- + Prune and destroy infected branches and leaves to improve ventilation
- + Post-harvest: Hot water treatment (50-55°C for 5-10 minutes) to reduce decay
- + Maintain good orchard hygiene and spacing
